

NEDCON Corner Protectors

In a warehouse with forklift trucks, the corner uprights are especially vulnerable.

That is why corner protectors are required by the European EN 15512 standard. NEDCON's corner protectors guide forklift trucks that pass at a close distance and absorb the force of collisions.

The corner protectors are free-standing, so that collisions have no effect on your racks. They are designed to optimally distribute forces. Your concrete floor will also remain undamaged. The corner protectors are fixed to rubber anchor blocks that absorb the energy of collision and leave your floor intact.

Advantages of the NEDCON corner protectors

- Protects corner uprights from collisions
- More than satisfies the EN 15512 standard
- No damage to concrete floor in case of collisions
- Free-standing so easy to replace
- Supplied as standard in yellow and black
- Available in all RAL colours

If it can be done,
consider it done

Damaged corner protectors can be replaced quickly and easily without significantly hindering your logistical processes.

Collision risk

If you would like to protect the entire side of your racks, then combine the corner protectors with a horizontal sigma profile. Corner protectors are supplied as standard in striking yellow and black, but are also available in all RAL colours. For racks that are at high risk of collisions, NEDCON has additional protection for the other uprights, such as stiffeners and the sturdy Defender, that can absorb up to 3000 Joules of collision energy.
