

NEDCON Flow Racks

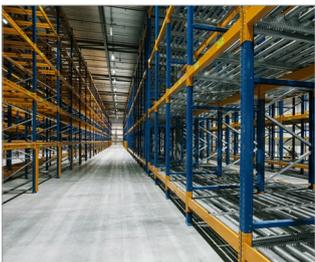

For order picking involving small packages with high turnover, flow racks have the advantage that they make buffers possible for the pick location.

As soon as you empty a container or remove a box, the next one will roll to the front. This way, the order pickers can continue their work without interruption. NEDCON has added a few more advantages.

**If it can be done,
consider it done**

The advantages of NEDCON flow racks

- Uninterrupted order picking because the next product rolls to the front by itself
- Easy to assemble thanks to unique profile of rollers and lines
- Easy to adjust, when changing to a new type of packaging/box for example
- Equipped with finger protection and other safety features
- Suitable for a wide range of types and sizes of packaging
- Roller tracks are galvanised and all other parts are available in all RAL colours
- Limited number of (standard) components required
- Suitable for first in first out (FIFO) order picking
- Maintenance free and future-proof with high residual value

If it can be done,
consider it done

Flow racks use gravity: the boxes and packages roll down a slight slope one by one. Here, NEDCON has developed unique rollers. These are extra wide and are placed in a stronger profile. This means that fewer roller tracks are required and that these lines can handle a greater span - definitely up to 1.5 metres with loads of 25kg per box or container (60 cm deep). The result: an easy to assemble system with fewer components, that is also easy to adjust. For example, if you want to use different boxes or adjust the slope.

Easy to combine

The flow racks available from NEDCON make an excellent combination with pallet racks and shelving systems. NEDCON can also supply custom made flow racks for pallet goods with high turnover rates, adjusted according to pallet weight.
